ELECTRONIC TRANSPORT MOVEMENT CONTROL

ZEBRAXX for Symbian S60 user guide

Introduction

Our "ZEBRAXX for symbian" application turns your mobile phone into a real-time-tracking device without additional hardware esp. a GPS receiver. You can track your phone(s) on the internet in real-time e.g. for the purpose of fleet tracking.

The following devices are supported at the moment:

Nokia 3250, 5500, 6110 Navigator, 6290, E50, E60, E61, E61i, E62, E65, E70, E90, N71, N73, N75, N80, N91, N92, N93, N95

Installation

1. Download the installation program with your phone. The file name is Zebraxx_S60_3_0_v_1_22_0.SIS or similar.

2. Installation starts usually by itself. A new ZEBRAXX icon appears on the bottom of the application menu.

3. Make sure you have an internet access point in your phone connection settings. The access point should use packet data and TCP/IP protocol.

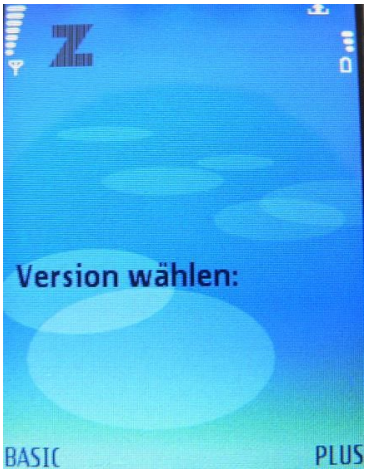
4. Start ZEBRAXX for Symbian.
At the first start you are prompted to select between BASIC and PLUS Version.

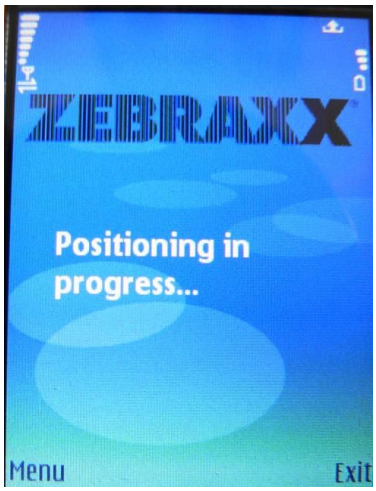
You can use the BASIC software free of charge for 14 days after installation.

In case you already have a ZEBRAXX account for you fleet you can use the PLUS version to easily add new phones to your fleet.

In the BASIC version please enter your name, a valid (!) email address and the phone number of your mobile phone. Press "Menu" and "OK" to create a new account. You will be prompted to confirm the connection to the internet. You can deactivate this warning message within the options menu "internet settings". You can set Prompt for billable event to "NO". After the confirmation you will receive an email including the login data for the test period of the ZEBRAXX system to monitor your fleet on the internet.

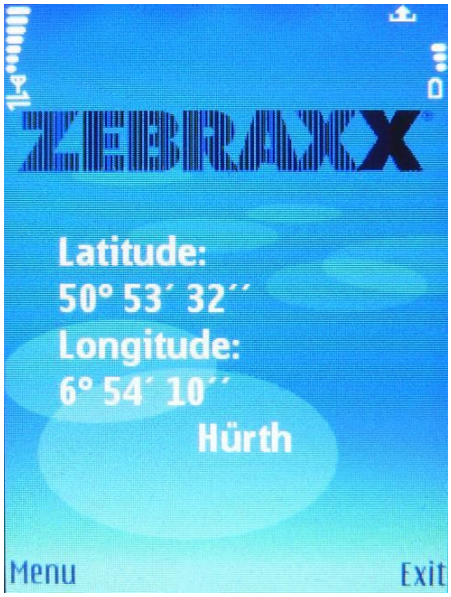
Please restart the application after you successfully created your account and start a test drive for a couple of kilometres.





ELECTRONIC TRANSPORT MOVEMENT CONTROL

Usage of the mobile client

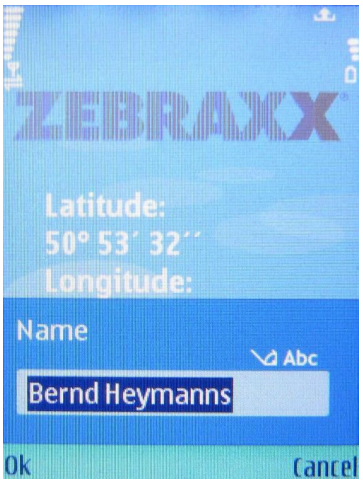


In case the location request was successful you should see your actual geocoordinates on your phone and optionally your city name. It should look like this.

Latitude and longitude data is also available on ZEBRAXX internet platform.

Interval settings can be changed via ZEBRAXX support team free of charge.

Within the options menu you can change the language, name and phone number. You can also set the application to AUTOSTART = ON to start the application automatically in case you restart the phone. You can use "HIDE" to hide the application to the background.



In case of technical problems you can select "debug mode" to test the message transfer between ZEBRAXX and you phone. This might help our support team in case of technical problems. You can contact our support via
